

Basic Linux/Unix Commands with Examples

File Management becomes easy if you know the right commands.

Sometimes, **commands are also referred as "programs" since whenever you run a command, it's the corresponding program code, written for the command, which is being executed.**

Listing files (ls)

If you want to see the list of files on your UNIX or Linux system, use the '**ls**' command.

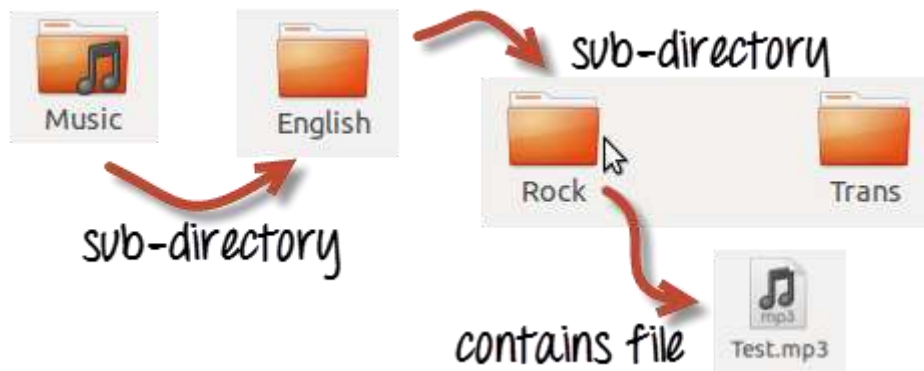

It shows the files /directories in your current directory.

```
guru99@VirtualBox:~$ ls
Desktop    Downloads    Music    Public    Videos
Documents  examples.desktop  Pictures  Templates
guru99@VirtualBox:~$
```

Note:

- Directories are denoted in blue color.
- Files are denoted in white.
- You will find similar color schemes in different flavors of Linux.

Suppose, your "Music" folder has following sub-directories and files.

You can use '**ls -R**' to show all the files not only in directories but also subdirectories

```

guru99@VirtualBox:~$ ls -R
.:
Desktop    Downloads  Music      Public     Videos
Documents  examples.desktop  Pictures  Templates

./Desktop:

./Documents:

./Downloads:

./Music:
English

./Music/English:
Rock  Trans

./Music/English/Rock:
Test.mp3

./Music/English/Trans:

./Pictures:

./Public:

./Templates:

./Videos:
guru99@VirtualBox:~$

```

NOTE: The command is case-sensitive. If you enter, "**ls -r**" you will get an error.

'**ls -al**' gives detailed information of the files. The command provides information in a columnar format. The columns contain the following information:

1 st Column	File type and access permissions
2 nd Column	# of HardLinks to the File
3 rd Column	Owner and the creator of the file
4 th Column	Group of the owner
5 th Column	File size in Bytes
6 th Column	Date and Time
7 th Column	Directory or File name

Let's see an example -

The terminal shows the output of the command `ls -al` in a dark-themed window. Handwritten annotations in red and green ink point to specific parts of the output:

- # of HardLinks:** Points to the '22' in the first line of the file listing.
- owner of file:** Points to 'n100' in the first line.
- Size in Bytes:** Points to '4096' in the first line.
- Directory or File Name:** Points to '.' in the first line.
- File type and Access Permissions:** Points to 'drwxr-xr-x' in the first line.
- Usergroup:** Points to 'n100 n100' in the first line.
- Date & Time:** Points to '2012-08-18 18:09' in the first line.
- bash_history:** Points to the filename 'bash_history' in the third line.

The terminal output is as follows:

```

n100@N100: ~
n100@N100:~$ ls -al
total 220
drwxr-xr-x 22 n100 n100 4096 2012-08-18 18:09 .
drwxr-xr-x  3 root root 4096 2012-08-18 04:36 ..
-rw-----  1 n100 n100  117 2012-08-18 18:12 .bash_history

```

Listing Hidden Files

Hidden items in UNIX/Linux begin with a **“period” symbol** at the start, of the file or directory.

Any Directory/file starting with a '.' will not be seen unless you request for it. To view hidden files, use the command.

```
ls -a
```

```
guru99@VirtualBox:~$ ls -a
.          .dmrc          .ICEauthority  sample
..         Documents  .local         sample1
.bash_history Downloads      .mission-control sample2
.bash_logout examples.desktop Music          Templates
.bashrc     .gconf         Pictures       .thumbnails
.cache      .gnome2        .profile       Videos
.config     .gstreamer-0.10 Public         .Xauthority
.dbus       .gtk-bookmarks .pulse         .xsession-error
Desktop     .gvfs          .pulse-cookie
```

Creating & Viewing Files

The 'cat' command is used to display text files. It can also be used for copying, combining and creating new text files. Let's see how it works.

To create a new file, use the command

1. cat > filename
2. Add content
3. Press 'ctrl + d' to return to command prompt.

Create a File
guru99@VirtualBox:~\$ cat > sample1

Enter Content
This is sample1

Press Control + D to exit
guru99@VirtualBox:~\$

To view a file, use the command -

```
cat filename
```

Let's see the file we just created -

```
guru99@VirtualBox:~$ cat sample1
This is sample1
```

Let's see another file sample2

```
guru99@VirtualBox:~$ cat > sample2
This is sample2
```

The syntax to combine 2 files is -

```
cat file1 file2 > newfilename
```

Let's combine sample 1 and sample 2.

```
guru99@VirtualBox:~$ cat sample1 sample2 > sample
```

As soon as you insert this command and hit enter, the files are concatenated, but you do not see a result. This is because **Bash Shell (Terminal) is silent type**. Shell Commands will never give you a confirmation message like "OK" or "Command Successfully Executed". It will only show a message when something goes wrong or when an error has occurred.

To view the new combo file "sample" use the command

```
cat sample
```

```
guru99@VirtualBox:~$ cat sample
This is sample1
This is sample2
```

Note: Only text files can be displayed and combined using this command.

Deleting Files

The 'rm' command removes files from the system without confirmation.

To remove a file use syntax -

```
rm filename
```

List current contents of directory

```
guru99@VirtualBox:~$ ls
Desktop  Downloads  Music  [Public sample1 Templates
Documents examples.desktop Pictures sample sample2 Videos
```

Remove the file sample1

```
guru99@VirtualBox:~$ rm sample1
```

List directory, to check file has been deleted

```
guru99@VirtualBox:~$ ls
Desktop  Downloads  Music  Public sample2 Videos
Documents examples.desktop Pictures sample Templates
guru99@VirtualBox:~$
```

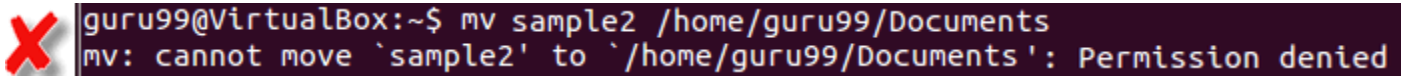

Moving and Re-naming files

To move a file, use the command.

```
mv filename new_file_location
```

Suppose we want to move the file "sample2" to location /home/guru99/Documents. Executing the command

```
mv sample2 /home/guru99/Documents
```

A terminal window with a dark background. The prompt is 'guru99@VirtualBox:~\$'. The command entered is 'mv sample2 /home/guru99/Documents'. The output is 'mv: cannot move `sample2' to `/home/guru99/Documents': Permission denied'. A red 'X' icon is on the left.

```
guru99@VirtualBox:~$ mv sample2 /home/guru99/Documents
mv: cannot move `sample2' to `/home/guru99/Documents': Permission denied
```

mv command needs super user permission. Currently, we are executing the command as a standard user. Hence we get the above error. To overcome the error use command.

```
sudo command_you_want_to_execute
```

Sudo program allows regular users to run programs with the security privileges of the superuser or root.

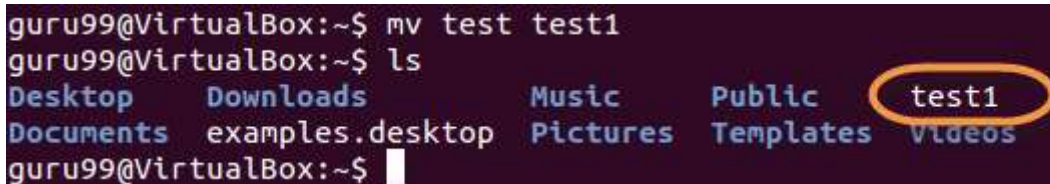

Sudo command will ask for password authentication. Though, you do not need to know the root password. You can supply your own password. After authentication, the system will invoke the requested command.

Sudo maintains a log of each command run. System administrators can trackback the person responsible for undesirable changes in the system.

```
guru99@VirtualBox:~$ sudo mv sample2 /home/quru99/Documents
[sudo] password for guru99: ****
guru99@VirtualBox:~$
```

Re-naming files

```
mv filename newfilename
```

A terminal window with a dark background. The prompt is 'guru99@VirtualBox:~\$'. The command entered is 'mv test test1'. The prompt is 'guru99@VirtualBox:~\$'. The command entered is 'ls'. The output is a directory listing: Desktop, Downloads, Music, Public, test1, Documents, examples.desktop, Pictures, Templates, Videos. The file 'test1' is circled in orange.

```
guru99@VirtualBox:~$ mv test test1
guru99@VirtualBox:~$ ls
Desktop  Downloads  Music      Public    test1
Documents examples.desktop Pictures    Templates Videos
guru99@VirtualBox:~$
```

NOTE: By default, the password you entered for sudo is retained for 15 minutes per terminal. This eliminates the need of entering the password time and again.

You only need root/sudo privileges, only if the command involves files or directories not owned by the user or group running the commands

Directory Manipulations

Enough with File manipulations! Let's learn some directory commands.

Creating Directories

Directories can be created on a Linux operating system using the following command

```
mkdir directoryname
```

This command will create a subdirectory in your present working directory, which is usually your "Home Directory".

For example,

```
mkdir mydirectory
```

```
home@VirtualBox:~$ mkdir mydirectory
home@VirtualBox:~$ ls
Desktop    Downloads    Music    Pictures    Templates
Documents  examples.desktop  mydirectory  Public    Videos
home@VirtualBox:~$
```

If you want to create a directory in a different location other than 'Home directory', you could use the following command

```
mkdir /tmp/MUSIC
```

will create a directory 'Music' under '/tmp' directory

```
home@VirtualBox:~$ mkdir /tmp/MUSIC
home@VirtualBox:~$ ls /tmp
keyring-yCD2no  pulse-0b9vyJcXyHZz  ssh-SSSsjczv1036  virtual-home.HaC7Mw
MUSIC          pulse-PKdhtXMmr18n  unity_support_test.1
home@VirtualBox:~$
```

You can also create more than one directory at a time.

```
home@VirtualBox:~$ mkdir dir1 dir2 dir3
home@VirtualBox:~$ ls
Desktop  dir2  Documents  examples.desktop  Pictures  Templates
dir1    dir3  Downloads  Music             Public    Videos
home@VirtualBox:~$
```

Removing Directories

To remove a directory, use the command -

```
rmdir directoryname
```

Example

```
rmdir mydirectory
```

will delete the directory mydirectory

```
home@VirtualBox:~$ rmdir mydirectory
home@VirtualBox:~$ ls
Desktop  dir2  Documents  examples.desktop  Pictures  Templates
dir1    dir3  Downloads  Music             Public    Videos
home@VirtualBox:~$
```

Tip: Ensure that there is no file / sub-directory under the directory that you want to delete. Delete the files/sub-directory first before deleting the parent directory.

```
home@VirtualBox:~$ rmdir Documents
rmdir: failed to remove `Documents': Directory not empty
home@VirtualBox:~$
```

Renaming Directory

The 'mv' (move) command (covered earlier) can also be used for renaming directories. Use the below-given format:

```
mv directoryname newdirectoryname
```

Let us try it:

```
home@VirtualBox:~$ mv mydirectory newdirectory
home@VirtualBox:~$ ls
Desktop      Downloads      Music          Pictures      Templates
Documents    examples.desktop newdirectory    Public        Videos
home@VirtualBox:~$
```

Other Important Commands

The 'Man' command

Man stands for manual which is a reference book of a Linux operating system. It is similar to HELP file found in popular software.

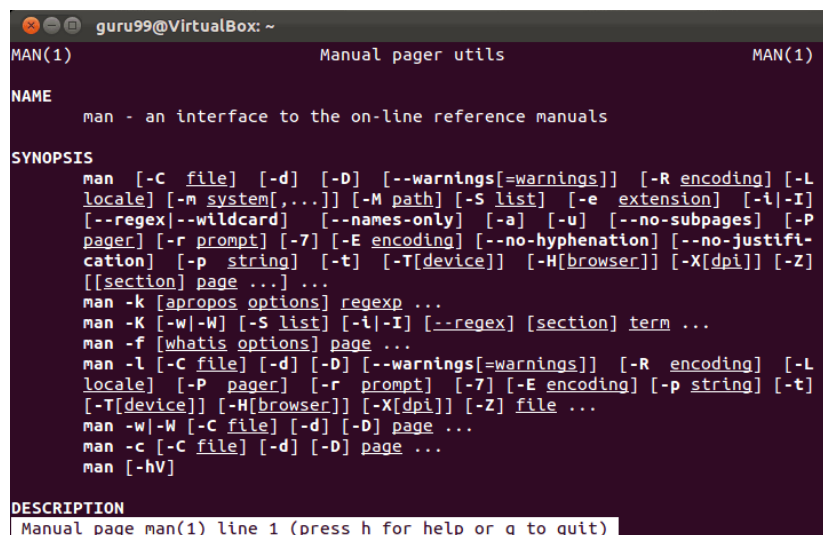

To get help on any command that you do not understand, you can type

```
man
```

The terminal would open the manual page for that command.

For an example, if we type *man man* and hit enter; terminal would give us information on man command

```
guru99@VirtualBox:~$ man man
```

```
MAN(1)                                Manual pager utils                                MAN(1)

NAME
    man - an interface to the on-line reference manuals

SYNOPSIS
    man [-C file] [-d] [-D] [--warnings[=warnings]] [-R encoding] [-L
    locale] [-m system[,...]] [-M path] [-S list] [-e extension] [-i|-I]
    [--regex|--wildcard] [--names-only] [-a] [-u] [--no-subpages] [-P
    pager] [-r prompt] [-7] [-E encoding] [--no-hyphenation] [--no-justifi-
    cation] [-p string] [-t] [-T[device]] [-H[browser]] [-X[dpi]] [-Z]
    [[section] page ...] ...
    man -k [apropos options] regexp ...
    man -K [-w|-W] [-S list] [-i|-I] [--regex] [section] term ...
    man -f [whatis options] page ...
    man -l [-C file] [-d] [-D] [--warnings[=warnings]] [-R encoding] [-L
    locale] [-P pager] [-r prompt] [-7] [-E encoding] [-p string] [-t]
    [-T[device]] [-H[browser]] [-X[dpi]] [-Z] file ...
    man -w|-W [-C file] [-d] [-D] page ...
    man -c [-C file] [-d] [-D] page ...
    man [-hv]

DESCRIPTION
    Manual page man(1) line 1 (press h for help or q to quit)
```

The History Command

History command shows all the commands that you have used in the past for the current terminal session. This can help you refer to the old commands you have entered and re-used them in your operations again.

```
guru99@VirtualBox:~$ history
1  cat > sample
2  cat sample
3  cat sample ^a
4  cat sample a
5  cat sample | grep a
6  cat sample | grep ^a
7  useradd home
8  useradd mycomputer
9  sudo useradd mycomputer
10 sudo adduser MyLinux
11 sudo adduser mylinux
12 vi scriptsample.sh
```

The clear command

This command clears all the clutter on the terminal and gives you a clean window to work on, just like when you launch the terminal.

```
141 man
142 3a
143 man intro
144 man ls
145 man cat
146 man man
147 history
148 146
149 history 146
150 history
151 clear
152 history
guru99@VirtualBox:~$ clear
```

The window gets cleared

```
guru99@VirtualBox:~$
```

Keyboard Shortcuts

Arrow Up / Down	Previously used command.
TAB	Auto Complete (type at least 1 character then press TAB)

Installing Software

In windows, the installation of a program is done by running the setup.exe file. The installation bundle contains the program as well various dependent components required to run the program correctly.

In Linux/UNIX, installation files are distributed as packages. But the package contains only the program itself. Any dependent components will have to be installed separately which are usually available as packages themselves.

You can use the **apt** commands to install or remove a package. Let's update all the installed packages in our system using command -

```
sudo apt-get update
```

To install a software from the repository. The command syntax is -

```
sudo apt-get install packagename
```

```
sudo apt-get install firefox (installs firefox)
```

```
guru99@VirtualBox:~$ sudo apt-get update
Ign http://extras.ubuntu.com precise InRelease
Ign http://security.ubuntu.com precise-security InRelease
Ign http://in.archive.ubuntu.com precise InRelease

Fetched 1,293 kB in 27s (47.4 kB/s)
Reading package lists... Done
guru99@VirtualBox:~$
```

The easy and popular way to install programs on Ubuntu is by using the Software center as most of the software packages are available on it and it is far more secure than the files downloaded from the internet.

Linux Mail Command

For sending mails through a terminal, **you will need to install packages 'mailutils'**.

Once done, you can then use the following syntax for sending an email.

```
mail -s 'subject' -c 'cc-address' -b 'bcc-address' 'to-address'
```

This will look like:

```
home@VirtualBox:~$ mail -s "News Today" abc@ymail.com
Hi,

The news for today follows.

1. Abs named as the biggest company.
2. ....
.
```

Press Cntrl+D you are finished writing the mail. The mail will be sent to the mentioned address.

Linux Command List

Below is a Cheat Sheet of Linux commands we have learned in this tutorial

Command	Description
ls	Lists all files and directories in the present working directory
ls - R	Lists files in sub-directories as well
ls - a	Lists hidden files as well
ls - al	Lists files and directories with detailed information like permissions, size, owner, etc.
cat > filename	Creates a new file
cat filename	Displays the file content
cat file1 file2 > file3	Joins two files (file1, file2) and stores the output in a new file (file3)
mv file "new file path"	Moves the files to the new location
mv filename new_file_name	Renames the file to a new filename
sudo	Allows regular users to run programs with the security privileges of the superuser or root
rm filename	Deletes a file
man	Gives help information on a command
history	Gives a list of all past commands typed in the current terminal session
clear	Clears the terminal
mkdir directoryname	Creates a new directory in the present working directory or a at the specified path
rmdir	Deletes a directory
mv	Renames a directory
apt-get	Command used to install and update packages
mail -s 'subject' -c 'cc-address' -b 'bcc-address' 'to-address'	Command to send email
mail -s "Subject" to-address < Filename	Command to send email with attachment
